Parameter recovery: verification requirements

Independent calibration

Freeze parameters and the observation model; keep calibration and human test data disjoint.

Synthetic recovery

Generate from the frozen model, refit, and evaluate bias, interval coverage and parameter trade-offs.

Identifiability gate

Use scaled information-matrix diagnostics and registered tolerances before confirmatory tests.

Missing source results

The supplied image contains recovery statistics without the generating fits. They are not reasserted here.

Quantitative panels pending verified recovery/sweep outputs from the canonical 1.1 implementation.
