Sensitivity and robustness: verification requirements

Freeze the model

Use relative effective precision and excess-surprise accumulation; enforce all gain constraints.

Controlled perturbations

Vary parameters over specified ranges; track both sign and magnitude of changes.

Independent realizations

Archive seeds, per-run outcomes and pass criteria; distinguish robustness from empirical validation.

Unverified legacy values

The supplied code hard-codes ±50% effects and 10,000-run percentages. No raw sweep is included.

Quantitative panels pending verified recovery/sweep outputs from the canonical 1.1 implementation.
