Stimulation and intracranial recording test distinct predictions

Protocol 5 / non-invasive intervention

Right aINS: tFUS / dTMS + matched sham
dlPFC / PPC: TMS reference comparisons

Target engagement gates aINS inference.
Separate resting PCI probes.
95% HDI + BF evidence for HEP equivalence.

No universal vertex-sham assumption.

Protocol 6 / implanted electrodes

500 ms fixation → 33 ms Gabor → 1 s delay
600 trials on an absolute contrast grid

Clinically indicated electrodes only.
Fixed-contrast bimodality; regional controls.
AC1 estimation requires validation.

Coverage-specific sample sizes reported.

Protocol JSON overrides the older manuscript/bundle 60 ms target and 250 ms response schematic.
