Clinical profiles require specificity controls

Profile	Proposed disturbance	Evaluation
Major depression	L1 interoceptive precision ↓; multilevel threshold changes	Prespecified APGI profile versus generic EEG features
Schizophrenia	L2 precision genotype-dependent; cross-level coupling disruption	Do not impose one universal precision direction
Disorders of consciousness	Clinical biomarker study; HEP and PCI eligibility differ	Pred 7.G primary prognosis; joint biomarker estimative

APGI 1.1 / P3F4 / Specification schematic

Paper 3: AUC ≥0.75, within-site label permutations, ΔAUC ≥0.05 beyond generic EEG features with BCa CI excluding zero.
